

1.

Which of the following do not make stack as efficient data structure ?

- A. Memory Consumption**
- B. LIFO implementation**
- C. Constant time span for all operations i.e.O(1)**
- D. FILO implementation**

Answer: A

2.

In case of stack data structure there is not limitation

- A. Where to add element**
- B. Where to remove element from**
- C. Where to retrieve element from**
- D. To check empty state of the stack**

Answer: D

3.

Stacks can be used in language processing for functions like _____, and _____.

- A. Expression Evaluation, Process Scheduling**
- B. balanced parentheses, binary expression evaluation**
- C. Syntax Checking, Breadth First Search**
- D. Memory Management, Process Scheduling**

Answer: B

4.

This _____ nature, where operations reduce the problem to smaller instances of the same type of data, embodies the essence of recursion.

A. Divide and Conquer

B. Self-referential (caller and called data type is same)

C. In-Place

D. Parsing

Answer: B

5.

In expression conversion from infix to postfix if element has been received as ')' then we should

A. Join it to postfix

B. Push ')' on stack

C. pop() elements from stack till '('

D. Peek element and then pop() element

Answer: C
